**The confidence limits represent the range of rates between which the true rate of infection could feasibly lie and will be wider for those Trusts with fewer operations. Very low, or very high rates that are based on a small number of procedures should therefore not be taken at face value but should be interpreted in conjunction with the confidence limits. The conventional method of calculating confidence limits could be misleading for rates based on less than 50 operations, as they overestimate the true upper 95% limit, and for this reason they have not been included for Trusts with less than 50 operations in a particular orthopaedic category.
